Chapter 1

General information

Introduction

The PCL-731 is a 48-bit DIO card. It provides you with 48 bits of parallel digital input/output and emulates mode 0 of the 8255 PPI chip. Buffered inputs and outputs offer a high driving capacity.

The card's 48 bits are divided into six 8-bit I/O ports: A0, B0, C0, A1, B1 and C1. You can configure each port as either input or output via software. The card also offers two hardware interrupt lines to the PC.

The card offers two 50-pin OPTO-22 compatible connectors which can connect to a PCLD-7216 SSR I/O module carrier board, PCLD-885 power relay output board, PCLD-785B and PCLD-7225 24/16-channel relay output boards or a PCLD-782B 24/16 channel opto-isolated D/I board.

Features

- 48 TTL digital I/O lines.
- Emulates mode 0 of 8255 PPI
- Interrupt handling
- OPTO-22 compatible 50-pin connectors
- Output status readback

Applications

- Industrial AC/DC I/O module monitoring and control
- Relay and switch monitoring and control
- Parallel data transfer
- Sensing the signals of TTL, DTL, CMOS logic
- Driving indicator LEDs

Specifications

I/O address assignments

Address	...	Function
BASE+0		PORT A0
BASE+1		PORT B0
BASE+2		PORT C0
BASE+3		CFG REG
BASE+4		PORT A1
BASE+5		PORT B1
BASE+6		PORT C1
BASE+7		CFG REG

Input signal

- Logic** high voltage: 2.0 to 5.25 V
- Logic** low voltage: 0.0 to 0.80 V
- High level input current: 20 μ A
- Low** level input current: -0.2 mA

Output signal

- Logic high voltage: 2.4 V Min.
- Logic** low voltage: 0.4 V Max.
- High level output current: -15 mA Max. (source)
- Low** level output current: 24 mA Max. (sink)
- Driving capacity: 15 LS **TTL**

Transfer rate

- Typical: 300 Kbytes/sec
- Maximum: 500 Kbytes/sec

Power consumption

- **Typical:** 0.5 A @ 5 Vdc (+/-5%)
- **Connector:** Two OPTO-22 compatible 50-pin connectors (CN1 and CN2)

Chapter 2

Installation

Initial inspection

Before you install the PCL-731, first check to make sure it was not damaged during shipping. If you find any damage or the card fails to meet specifications, please contact your local dealer or sales representative. Also contact the shipper and save the shipping materials for the shipper's inspection.

Switch and jumper settings

We designed the PCL-731 with ease-of-use in mind. It has one function switch and six jumper settings. The following sections tell how to configure the card. You may want to refer to the figure below for help in identifying card components.

Warning: Do not install or remove the PCL-731 I/O card while the power is ON, as this may damage the card.

The following diagram shows the location of switches and jumpers:

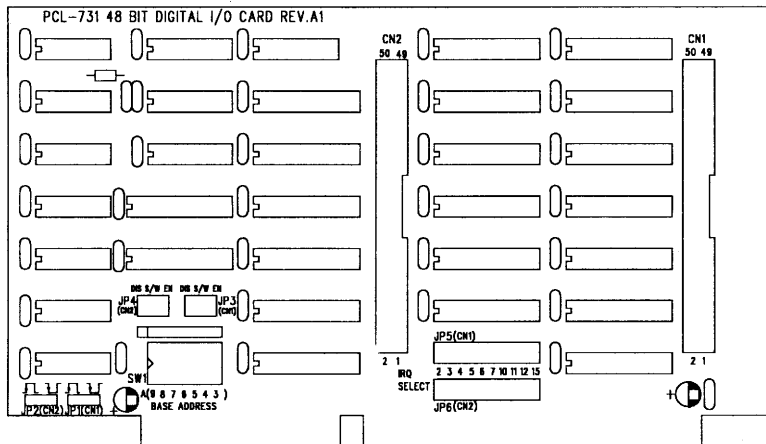

Figure 2-1: Jumper and switch locations

Base address selection (SW1)

You control the PCL-731's operation by reading or writing data to the PC's I/O (input/output) port addresses. The card requires 8 consecutive address locations. Switch SW1 sets the card's base (beginning) address. Valid base addresses range from Hex 000 to Hex 3F8. Other devices in your system may, however, be using some of these addresses.

We set the PCL-73 1 for a base address of Hex 300 at the factory. If you need to adjust it to some other address range, set switch SW1 as shown below:

Card I/O addresses (SW1)

Range (hex)	Switch position						
	1	2	3	4	5	6	7
000 - 007	On	On	On	On	On	On	On
008 - 00F	On	On	On	On	On	On	Off
200 - 207	Off	On	On	On	On	On	On
208 - 20F	Off	On	On	On	On	On	Off
*300 - 307	Off	Off	On	On	On	On	On
3F8 - 3FF	Off	Off	Off	Off	Off	Off	Off

* = default

Switches 1-7 control the PC bus address lines as follows:

Switch	1	2	3	4	5	6	7
Line	A9	A8	A7	A6	A5	A4	A3

Interrupt settings (JP5, JP6)

Jumpers JP5 and JP6 control the IRQ levels, as shown below:

JP5 (PC00)
(Default)

JP6 (PC10)
(Default)

Note: You must set each I/O line to a different interrupt level.

Interrupt level (JP1, JP2)

Jumpers JP1 and JP2 select the trigger edge (rising or falling) for I/O lines PC00 and PC10, respectively. Jumpers settings appear below:

Rising edge interrupt triggering
(Default)

Falling edge interrupt triggering

If you set the PCL-73 1 to trap on a rising edge, the card will generate an interrupt if the I/O line (PC00 or PC10) changes from TTL LOW to TTL HIGH. Conversely, if you set the card to trap on a falling edge change, then it will generate an interrupt when the I/O line changes from TTL HIGH to TTL LOW.

Interrupt mode (JP3, JP4)

The PCL-731 provides two I/O lines (PC00 and PC10) which you can use to generate hardware interrupts to the PC. Jumper JP3 controls interrupt line PC00, and jumper JP4 controls interrupt line PC10. The DIS setting for each jumper (shown in the figure below) disables the corresponding line's interrupt capability. The EN setting enables the line's interrupt capability.

JP3 and JP4

(Default)

The S/W setting allows you to enable and disable control by external or programmable interrupt. I/O line PC04 controls the interrupt on line PC00, and line PC14 controls the interrupt on line PC10. Bring line PC04 to TTL LOW to enable the interrupt capability on PC00. Send line PC04 to TTL HIGH to disable the interrupt capability on PC00. I/O line PC14 controls PC10 in the same way.

Chapter 3

Operation

The PCL-731 emulates MODE 0 of an Intel 8255 programmable peripheral interface (PPI) chip. The card is pin compatible with most industrial solid state I/O racks and modules, such as those manufactured by OPTO-22, Potter Brumfield, Gordos, etc.

The PCL-731's two 50-pin male IDC connectors interface with directly to OPTO-22 racks. The PCL-731 offers two I/O lines (PC00 and PC 10) to generate hardware interrupts, as described on page 10.

Configuration

Mode 0 of the 8255 provides simple input/output functions. No handshaking is required since you read or write data directly to or from a specified port.

8255 MODE 0 function definitions

- Six 8-bit ports (Port A0, B0, C0, A1, B1 and C1)
- Any port can be used for input or output
- Outputs are latched, whereas inputs are not latched

The PCL-731 requires ten I/O ports, identified below:

I/O port assignments

Location	Write	Read
BASE+0	8255 Port A0	8255 Port A0
BASE+1	8255 Port B0	8255 Port B0
BASE+2	8255 Port C0	8255 Port C0
BASE+3	8255 Mode Register for Ports A0, B0 and C0	N/A
BASE+4	8255 Port A1	8255 Port A1
BASE+5	8255 Port B1	8255 Port B1
BASE+6	8255 Port C1	8255 Port C1
BASE+7	8255 mode Register for Ports A1, B1 and C1	N/A

8255 data registers

The PCL-731's I/O ports (BASE+0 to 2 and BASE+4 to 6) directly map to the 8255 ports. Bit assignments for each I/O port appear below:

BASE+0 8255 Port A0 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PA07	PA06	PA05	PA04	PA03	PA02	PA01	PA00

BASE+1 8255 Port B0 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PB07	PB06	PB05	PB04	PB03	PB02	PB01	PB00

BASE+2 8255 Port C0 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PC07	PC06	PC05	PC04	PC03	PC02	PC01	PC00

BASE+4 8255 Port A1 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PA17	PA16	PA15	PA14	PA13	PA12	PA11	PA10

BASE+5 8255 Port B1 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PB17	PB16	PB15	PB14	PB13	PB12	PB11	PB10

BASE+6 8255 Port C1 (read/write)

Bit	7	6	5	4	3	2	1	0
Value	PC17	PC16	PC15	PC14	PC13	PC12	PC11	PG10

8255 made registers

BASE+3 8255 Mode Register, A0, B0, C0 (write)

Bit	7	6	5	4	3	2	1	0
Value	1	0	0	PA0	PC0H	0	PB0	PC0L

Where :

PA0: 0= Port A0 as output
1= Port A0 as input

PB0: 0 = Port B0 as output
1= Port B0 as input

PC0L: 0 = Port C0 low-nibble as output (PC03-PC00)
1= Port C0 low-nibble as input

PC0H: 0 = Port C0 high-nibble as output (PC07-PC04)
1 = Port C0 high-nibble as input

BASE + 7 8255 Mode Register, A1, B1, C1 (write)

Bit	7	6	5	4	3	2	1	0
Value	1	0	0	PA1	PC1H	0	PB1	PC1L

Where :

PA1: 0 = Port A1 as output
1= Port A1 as input

PB1: 0 = Port B1 as output
1= Port B1 as input

PC1L:0 = Port C1 low-nibble as output (PC13-PC10)
1= Port C1 low-nibble as input

PC1H:0 = Port C1 high-nibble as output (PC17-PC14)
1 = Port C1 high-nibble as input

Note: After power-on or reset, all ports (Port A0, B0, C0, A1, B1 and C1) are set to input mode.

Interrupt handling

The PCL-731 offers two I/O lines, PC00 and PC10, which you can use to generate a hardware interrupt to the CPU. Interrupts are edge-triggered. Please refer to page 10 for jumper settings and description.

Note: *Since the PCL-731's digital input data are not latched, the card provides no "first event" trapping to determine which input was active first.*

Although interrupts are normally triggered by external signals, the PCL-731 can send output data to emulate an interrupt signal. See the example programs in the following section.

Chapter 4

Programming

The following programming examples show how to use the card's readback function to monitor the output status, how to use the interrupt function (rising and falling edge) and how to set the initial value for the output port. The example programs run under Turbo C version 2.0 or later.

Programming notes

You can program the PCL-731's ports in software for input, output or tri-state. When you power-on or reboot your system, however, all of the ports will be reset to input. When you configure one of the ports for output for the first time and sent data to it, it will not output until you have set the output buffer. This prevents external devices from being damaged before they are initialized. When a port is set for output, a read action on the port will return the data to be output.

Demo programs
